The Most Powerful Apple Device Management for MSPs and IT Teams

Effortlessly manage macOS, iOS, iPadOS and tvOS devices across multiple clients and locations.

Innovative Infrastructure

Addigy is a cloud-based Apple Device Management solution. Our architecture eliminates the need for setting up, maintaining, and monitoring monolithic server instances across different sites. Addigy's solution centralizes all of the functionality needed to effectively manage and service Apple devices while abstracting away unnecessary and complicated items for both administrators and end-users. Addigy's innovative and lean technology stack provides highly scalable cutting-edge technology quickly and efficiently.

Powerful Administrative Framework

The Addigy Web application can be accessed from any browser and centralizes all the administrative logic for servicing & managing Apple devices. From within a simple web application, Addigy users can perform powerful administrative tasks at scale.

Live device access & management

Addigy has multiple remote-control capabilities that can be used right from the central web application. Apple administrators can leverage ConnectWise Control, Splashtop, Addigy Remote Control, GoLive, or the Addigy LiveTerminal which provides immediate command-line access to a managed device regardless of geographic location.

Real-time monitoring with automated remediation

Addigy provides real-time device statistics across an entire portfolio providing unparalleled visibility for Apple administrators and powerful tools to react to the state of devices. Leveraging Addigy, administrators can monitor the state of machines and automatically trigger remediation steps if certain conditions are met. This robust and innovative solution allows Apple administrators to scale their time efficiently and effectively.
Easy OS and software deployment & updating

With Addigy, there is no need to create and upload custom packages. Addigy has an extensive public software catalog regularly updated by the team and community. Addigy users can deploy custom or public software, configuration profiles, applications, and patches to their entire portfolio all from within the web application. Addigy removes the cumbersome tasks of manually uploading items to separate distribution points and provides real-time information regarding the deployment status of these items providing greater flexibility and visibility to users.

Administrators can also automatically apply system updates, Microsoft Office updates, and third-party patches all from within the web application without needing to host the software at separate distribution points.

>
> It's such a joy to be able to just push out an application to a user when they aren't looking. I had a user recently that couldn't launch Chrome, so I deleted the current version with Addigy Live Terminal, pushed out the new version from Deployments, and then asked the user to click the Chrome icon in their dock. All in real-time it took under a minute and the user was back in business.

Profile and device configuration & governance

Maintaining the configuration state of every Apple device in a portfolio is a mission critical task. Apple administrators who use Addigy can ensure that any device profiles and configurations stay enforced across their entire portfolio at all times.

Organization-wide security & compliance enforcement

Security is actively considered in every aspect of our product, along with every decision we make. With Addigy, Apple IT administrators can easily ensure that all security configurations stay enforced at a department or organization level.

Security features:

- Firewall Management
- Website Blocking
- FileVault Management
- Gatekeeper Enforcement
- Extensive Security Software Catalog
- Password Policy Enforcement
- Screensaver Password Settings
- SOC 2 Compliance
